# Goal and motivation

- Syntax studies the combination of words in a sentence.
- Syntactic parsing provides information of the combination of words in a sentence (the syntactic structure).
- Syntactic information is relevant for many LN applications:
  - Authorship recognition
  - Grammar checking
    - Ex: 3th-Singular-noun + basic-verb  $\Rightarrow$  error
  - Machine Translation
    - Ex: [es] NN+JJ  $\Rightarrow$  [en] JJ+NN
  - Information Extraction
    - Ex:  $X - [subj] \rightarrow \text{visited} \leftarrow [dobj] - Y \Rightarrow \text{visit}(X,Y)$
  - ...
- **Goal:** find the syntactic structure associated to a sentence.

# Theories of Syntactic Structure

## Constituent Trees

- Main element: constituents (or phrases, or bracketings)
- Constituents = abstract linguistic units
- Results in nested trees

## Dependency Trees

- Main element: dependency
- Focus on relations between words
- Handles *free word order* nicely.

Probabilistic  
Context Free  
Grammars  
(PCFGs)

[Hopcroft and Ullman 1979]

A context free grammar  $G = (N, \Sigma, R, S)$  where:

- $N$  is a set of non-terminal symbols
- $\Sigma$  is a set of terminal symbols
- $R$  is a set of rules of the form  $X \rightarrow Y_1 Y_2 \dots Y_n$   
for  $n \geq 0, X \in N, Y_i \in (N \cup \Sigma)$
- $S \in N$  is a distinguished start symbol

# Context Free Grammars, Example

$N = \{S, NP, VP, PP, DT, Vi, Vt, NN, IN\}$

$S = S$

$\Sigma = \{\text{sleeps, saw, man, woman, telescope, the, with, in}\}$

$R =$

S	$\Rightarrow$	NP	VP
VP	$\Rightarrow$	Vi	
VP	$\Rightarrow$	Vt	NP
VP	$\Rightarrow$	VP	PP
NP	$\Rightarrow$	DT	NN
NP	$\Rightarrow$	NP	PP
PP	$\Rightarrow$	IN	NP

Vi	$\Rightarrow$	sleeps
Vt	$\Rightarrow$	saw
NN	$\Rightarrow$	man
NN	$\Rightarrow$	woman
NN	$\Rightarrow$	telescope
DT	$\Rightarrow$	the
IN	$\Rightarrow$	with
IN	$\Rightarrow$	in

Note: S=sentence, VP=verb phrase, NP=noun phrase, PP=prepositional phrase, DT=determiner, Vi=intransitive verb, Vt=transitive verb, NN=noun, IN=preposition

Probabilistic  
Context Free  
Grammars  
(PCFGs)

# Left-most Derivations in CFGs

A left-most derivation is a sequence of strings  $s_1 \dots s_n$ , where

- $s_1 = S$ , the start symbol
- $s_n \in \Sigma^*$ , i.e.  $s_n$  is made up of terminal symbols only
- Each  $s_i$  for  $i = 2 \dots n$  is derived from  $s_{i-1}$  by picking the left-most non-terminal  $X$  in  $s_{i-1}$  and replacing it by some  $\beta$  where  $X \rightarrow \beta$  is a rule in  $R$

For example:  $[S]$ ,  $[NP VP]$ ,  $[D N VP]$ ,  $[the N VP]$ ,  $[the man VP]$ ,  $[the man Vi]$ ,  $[the man sleeps]$

Representation of a derivation as a tree:

# Properties of CFGs

Syntactic  
parsing

Context Free  
Grammars  
(CFGs)

Probabilistic  
Context Free  
Grammars  
(PCFGs)

- A CFG defines a set of possible derivations
- A string  $s \in \Sigma^*$  is in the *language* defined by the CFG if there is at least one derivation which yields  $s$
- Each string in the language generated by the CFG may have more than one derivation (“ambiguity”)

# Ambiguities

Syntactic  
parsing

Context Free  
Grammars  
(CFGs)

Probabilistic  
Context Free  
Grammars  
(PCFGs)

- I cleaned the dishes from dinner
- I cleaned the dishes with detergent
- I cleaned the dishes in my pajamas
- I cleaned the dishes in the sink

## Exercise

- How many parse trees can be read?
- Provide a CFG to get at least one of the possible parse trees

Probabilistic CFGs can be used to know how likely are the parse trees

Syntactic  
parsing

Grammars  
(PCFGs)

S	⇒	NP	VP	1.0
VP	⇒	Vi		0.4
VP	⇒	Vt	NP	0.4
VP	⇒	VP	PP	0.2
NP	⇒	DT	NN	0.3
NP	⇒	NP	PP	0.7
PP	⇒	P	NP	1.0

Vi	⇒	sleeps	1.0
Vt	⇒	saw	1.0
NN	⇒	man	0.7
NN	⇒	woman	0.2
NN	⇒	telescope	0.1
DT	⇒	the	1.0
IN	⇒	with	0.5
IN	⇒	in	0.5

- Probability of a tree  $t$  with rules

$$\alpha_1 \rightarrow \beta_1, \alpha_2 \rightarrow \beta_2, \dots, \alpha_n \rightarrow \beta_n$$

is

$$p(t) = \prod_{i=1}^n q(\alpha_i \rightarrow \beta_i)$$

where  $q(\alpha \rightarrow \beta)$  is the probability for rule  $\alpha \rightarrow \beta$ .

# Definition

1. A context-free grammar  $G = (N, \Sigma, S, R)$ .

2. A parameter

$$q(\alpha \rightarrow \beta)$$

for each rule  $\alpha \rightarrow \beta \in R$ . The parameter  $q(\alpha \rightarrow \beta)$  can be interpreted as the conditional probability of choosing rule  $\alpha \rightarrow \beta$  in a left-most derivation, given that the non-terminal being expanded is  $\alpha$ . For any  $X \in N$ , we have the constraint

$$\sum_{\alpha \rightarrow \beta \in R: \alpha = X} q(\alpha \rightarrow \beta) = 1$$

In addition we have  $q(\alpha \rightarrow \beta) \geq 0$  for any  $\alpha \rightarrow \beta \in R$ .

Given a parse-tree  $t \in \mathcal{T}_G$  containing rules  $\alpha_1 \rightarrow \beta_1, \alpha_2 \rightarrow \beta_2, \dots, \alpha_n \rightarrow \beta_n$ , the probability of  $t$  under the PCFG is

$$p(t) = \prod_{i=1}^n q(\alpha_i \rightarrow \beta_i)$$

Syntactic  
parsing

Context Free  
Grammars  
(CFGs)

Probabilistic  
Context Free  
Grammars  
(PCFGs)

# Properties of PCFGs

Syntactic  
parsing

Context Free  
Grammars  
(CFGs)

Probabilistic  
Context Free  
Grammars  
(PCFGs)

- Assigns a probability to each *left-most derivation*, or parse-tree, allowed by the underlying CFG
- Say we have a sentence  $s$ , set of derivations for that sentence is  $\mathcal{T}(s)$ . Then a PCFG assigns a probability  $p(t)$  to each member of  $\mathcal{T}(s)$ . i.e., *we now have a ranking in order of probability*.
- The most likely parse tree for a sentence  $s$  is

$$\arg \max_{t \in \mathcal{T}(s)} p(t)$$

# Learning Treebank Grammars

- Read the grammar rules from a treebank

- Set rule weights by maximum likelihood
- Other approaches are out of this course: PCFG with parent annotations, lexicalized PCFG, PCFG with latent variables

Syntactic  
parsing

Context Free  
Grammars  
(CFGs)

Probabilistic  
Context Free  
Grammars  
(PCFGs)

# Maximum Likelihood Estimates

- Algorithm

- 1 Given a treebank, define a CFG **by taking all rules seen in the treebank**
- 2 Maximum Likelihood estimates

$$q(\alpha \rightarrow \beta) = \frac{\text{Count}(\alpha \rightarrow \beta)}{\text{Count}(\alpha)}$$

where the counts are taken from the examples in the treebank.

- Smoothing issues apply here
- Having the appropriate CFG is critical to success

# Exercise

Using the following PCFG

$S \rightarrow NP VP$	1.0
$NP \rightarrow NP PP$	0.4
$PP \rightarrow P NP$	1.0
$VP \rightarrow V NP$	0.7
$VP \rightarrow VP PP$	0.3
$P \rightarrow with$	1.0
$V \rightarrow saw$	1.0
$NP \rightarrow astronomers$	0.1
$NP \rightarrow ears$	0.18
$NP \rightarrow saw$	0.04
$NP \rightarrow stars$	0.18
$NP \rightarrow telescope$	0.1

Work with the sentence: '*astronomers saw stars with ears*'

- How many correct parses are there for this sentence?
- Write them along with their probabilities.
